## **DETAILED ACTION**

## Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on April 30, 2007 has been entered.

## Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).
- 4. Claims 1, 3, 4, 9-11, 13, 14, 9-21, 23, 24, and 29-36 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent Application Publication No.

Application/Control Number: 10/816,762 Page 3

Art Unit: 2874

2003/0039455 to Ouchi in view of US Patent No. 5,857,042 Robertson et al. and US Patent No. 5,038,354 to Yagi

- 5. Regarding Claims 1, 11 and 21, Ouchi describes a computer system (see Paragraph 4) having a device for communicating between including a first electrical-to-optical semiconductor transducer (1131) to convert electrical signals into optical signals located on a face and a second optical-to-electrical semiconductor transducer (1141) configured to convert optical signals received from the first transducer into electrical signals located on a second face, where the first and second faces are oriented face-to-face so that the optical signal from the first die shines on the second die (see Figure 1 and Paragraphs 6-7). Ouchi does not describe the first and second transducers positioned on separate semiconductor dies.
- 6. Robertson et al. describes a device for communicating between a first semiconductor die (14) and a second semiconductor die (15) comprising an electrical-to-optical transducers (16A-16D) configured to convert electrical signals into optical signals (see Column 3) located on a face of the first die and optical-to-electrical transducers (17A-17D) configured to convert optical signals received from the first die into electrical signals (see Column 3) located on a face of the second die, where the first and second dies are oriented face-to-face so that the optical signal from the first die shines on the second die (see Figures 2-3 and Columns 2-4). The method of Claim 1 is embodied in the device described above.
- 7. Ouchi and Robertson et al. are analogous art from the same field of endeavor of optical communications between electrical circuits. At the time of invention, it would have been obvious to one of ordinary skill in the art to use the transducer set up of Ouchi with the separate die structure of Robertson et al. The motivation for doing so would have been to allow for

Application/Control Number: 10/816,762

Art Unit: 2874

optical connection between electrical circuits that are not coplanar. Therefore, it would have been obvious to one of ordinary skill in the art to combine Robertson et al. with Ouchi to obtain the invention as specified in the present claims.

Page 4

- 8. Further, neither Ouchi nor Robertson et al. describe annuli located within metal layers on the first semiconductor die configured to focus the optical signal onto the second die. Yagi describes an electrical –to-optical semiconductor transducer (see Figure 2) with annuli (14) in a metal layer (see Columns 2-3) for focusing an optical signal. At the time of invention, it would have been obvious to one of ordinary skill in the art to use the transducer element of Yagi in the combined device of Ouchi and Robertson et al. The motivation for doing so would have been to minimize optical losses via focusing the output optical signal.
- 9. The method of Claim 1 is embodied in the device described above.
- 10. Regarding Claims 3, 13 and 23, Robertson et al. describes lenses (19A-19D) that focus the optical signal on the second die.
- 11. Regarding Claims 4, 14, and 24, Ouchi describes a mirror (1133s) reflecting the optical signal and the transducers being perpendicular to each other (see Figure 1).
- 12. Regarding Claims 9, 19, and 29, Robertson et al. describes the electrical-to-optical transducers as VCSELs (23).
- 13. Regarding Claims 10, 20, and 30, Robertson et al. describes the optical-to-electrical transducers as PIN photo-diodes (see Column 3).
- 14. Regarding Claims 31-33 Ouchi further describes an interposer (1101) containing plural waveguides sandwiched between the transducers.

Application/Control Number: 10/816,762

Art Unit: 2874

15. Regarding Claims 34-36, Ouchi describes the electrical-to-optical transducer as one of a plurality, the optical-to-electrical transducer as one of a plurality and the signals as transmitted in parallel.

Page 5

- 16. Regarding Claims 21, 23, 24, 29, 30, 33, and 36, all of the limitations of these claims have been discussed concerning Claims 1, 3, 4, 10, 13, 14, 19, 20, 31-32, and 34-35 except for the inclusion of the described device in a computer system. Robertson does not specifically describe the device used in a computer system. However, it is well-known in the art to use optical transmission between chips in computer systems. Therefore, it would have been obvious to one of ordinary skill in the art to use the transducer setup described by Robertson in a computer system to allow for fast, dense communication between chips.
- 17. Claims 7, 8, 17, 18, 27, and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ouchi, Robertson et al., and Yagi as applied to claims 1, 11, and 21 above, and further in view of US Patent No. 6,374,012 to Bergmann et al.
- 18. Ouchi, Robertson et al., and Yagi do not describe the optical signals electronically steered to correct misalignments. Bergmann et al. describes electronically steering optical signals to correct for mechanical misalignment in X, Y, or Θ coordinates (see Figures 1-4 and Columns 4-8). At the time of invention, it would have been obvious to one of ordinary skill in the art to use the adjusting lens structure of Bergmann et al. for the lens structure of the above-described combined device of Ouchi, Robertson et al., and Yagi. The motivation for doing so would have been to finely tune, or "trim", the beam path to allow for optimized signal transmission (see Column 1 of Bergmann et al.).

Art Unit: 2874

Response to Arguments

19. Applicant's arguments filed April 30, 2007 have been fully considered but they are not

persuasive. Please see paragraph 7, above, discussing the obviousness of using annuli within

metal layers to focus an optical beam in light of the prior art, particularly the teachings of Yagi.

Conclusion

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Jerry T. Rahll whose telephone number is (571) 272-2356. The

examiner can normally be reached on M-F (9:00-5:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Rodney Bovernick can be reached on (571) 272-2344. The fax phone number for the

organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would

like assistance from a USPTO Customer Service Representative or access to the automated

information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
